

# BIOTRAP QUEENSLAND FRUIT FLY MONITORING KIT

Containing a Biotrap V1 trap and Mallet CL Lure

## INSTRUCTIONS FOR USE AND HANDLING PRECAUTIONS

The Biotrap monitoring kit consists of the Biotrap V1 trap and a male lure which is a wafer containing Cuelure (a male para-pheromone) and maldison (a contact insecticide). Only the male Queensland fruit fly (*Bactrocera tryoni*) is attracted to the lure which makes this system ideal for monitoring populations of this species.

The attractiveness of this lure will attract flies from up to 400 meters.

The wafer lure should be suspended on the hook within the lid of the trap (please wear gloves when handling the wafer) join the base and the lid of the trap together and hang at head height (approx. 1.5 meter) within the canopy of a tree, preferably on a eastern facing side. It is not necessary to hang in a fruiting tree.

Check and empty traps on a weekly basis and record numbers. If the numbers increase significantly then appropriate control measures will be necessary. Note that this trapping system is for monitoring purposes and will not control fruit fly.

**Replace wafer attractant after 4 months.**

### **CAUTION**

**KEEP OUT OF REACH OF CHILDREN**

**READ SAFETY DIRECTIONS BEFORE OPENING OR USING**

### **INSECT TRAP**

**ACTIVE CONSTITUENT: 0.5 g Maldison**
